Analysis Group is...

One of the largest economics consulting firms, with over 40 years of experience

Composed of 1,000+ professionals across 14 offices

An industry leader providing healthcare economic and financial analysis and consulting to a global client base

A collaborative team that works closely with a network of experts from leading academic institutions, industry, and government

01

Global Growth

Our Work

Leading law firms
retain us to represent
Fortune Global 500
companies

We partner with top
health care
organizations

To develop
analysis and
insights with global
scope and impact

Overview

Of our healthcare work

Health Economics and Outcomes Research (HEOR)	Epidemiology	Biostatistics	Health Policy
Payer Strategy and Payer Research	Market Research	Pricing	Market Access

HEOR (Health Economics and Outcomes Research)

The study of the *clinical* and *economic* implications of disease states and healthcare interventions

Economic implications

- **Focus:** Costs and use of healthcare resources (hospital stays, ER/outpatient visits, prescriptions)
- **Examples:**
 - Economic burden of diseases
 - Drug cost comparisons

Clinical implications

- **Focus:** Patient health outcomes
- **Examples:**
 - Comparisons of long-term health outcomes for patients with certain disease versus healthy people
 - Long-term survival of patients

Questions

Our work helps answer

Is a new therapy effective in patient groups not represented in the clinical trials?

What is the long-term safety of a new therapy?

How is value determined for innovative therapies?

What is the humanistic and/or economic burden of disease on society?

Which treatment saves more lives?

How can data analytics inform health care choices?

Types of HEOR Cases at AG

1. Regulatory real world evidence

- Studies to support product registration or post-approval safety studies based on routine medical data with chart review for outcome validation

2. Primary data collection

- Where study objectives cannot be met through existing data, AG designs the data collection and analyses the data. Includes Patient/physician surveys, patient registries, patient reported outcomes

3. Real world evidence

- Analyzes previously collected routine healthcare data to evaluate specific objectives such as identifying population level disease burden or treatment patterns in large, representative datasets. Datasets include electronic medical records, insurance claims data, chart review data

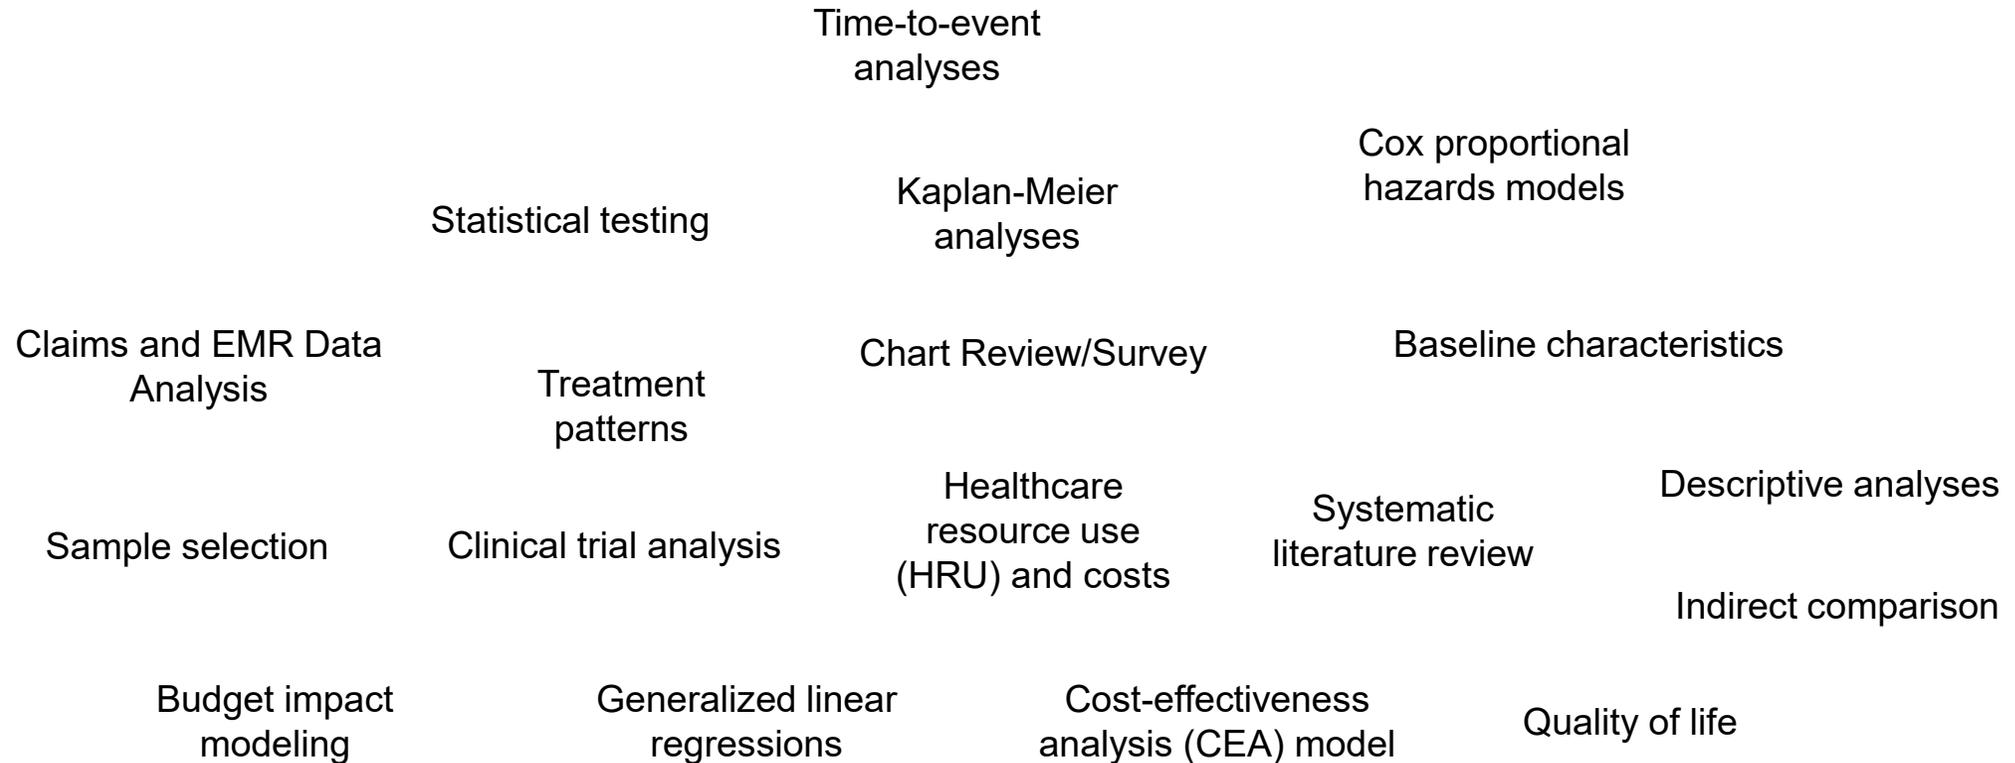

4. Economic modeling

- Data from various sources (e.g., literature, clinical trials, real world data) is compiled and analyzed within a new framework comparing clinical and economic outcomes of different interventions/events

02

Analytical Methods

HEOR statistical or research techniques

Analyst Role

Economic consultant

Data scientist

Statistician

Presenter/
communicator
